

this method, a plurality of non-precision landing approaches are selected for presentation on a display in accordance with verified conditions relating to the precision of measurements of parameters used in implementing the non-precision landing approach. Gibbs and Harenberg, considered alone or together, do not teach or suggest this feature, and the Office Action does not propose otherwise.

Accordingly, the Applicants submit that the Gibbs and Harenberg, considered individually or in combination, do not render obvious the subject matter defined by claim 21. Independent claim 37 similarly recites the above-mentioned feature distinguishing method claim 21 from the applied references, but with respect to an apparatus. Therefore, allowance of claims 21 and 37 and all claims dependent therefrom is warranted.

Claim 22 recites selecting a plurality of non-precision landing approaches for presentation on a display in accordance with verified conditions relating to the uncertainty of a measured position value of the aircraft. Gibbs and Harenberg, considered alone or together, do not teach or suggest this feature. Therefore, allowance of claim 22 is warranted for this independent reason.

In view of the above, it is submitted that this application is in condition for allowance and a notice to that effect is respectfully solicited.

If any issues remain which may best be resolved through a telephone communication, the Examiner is requested to telephone the undersigned at the local Washington, D.C. telephone number listed below.

Respectfully submitted,

James E. Ledbetter
